The North Central Texas Council of Governments

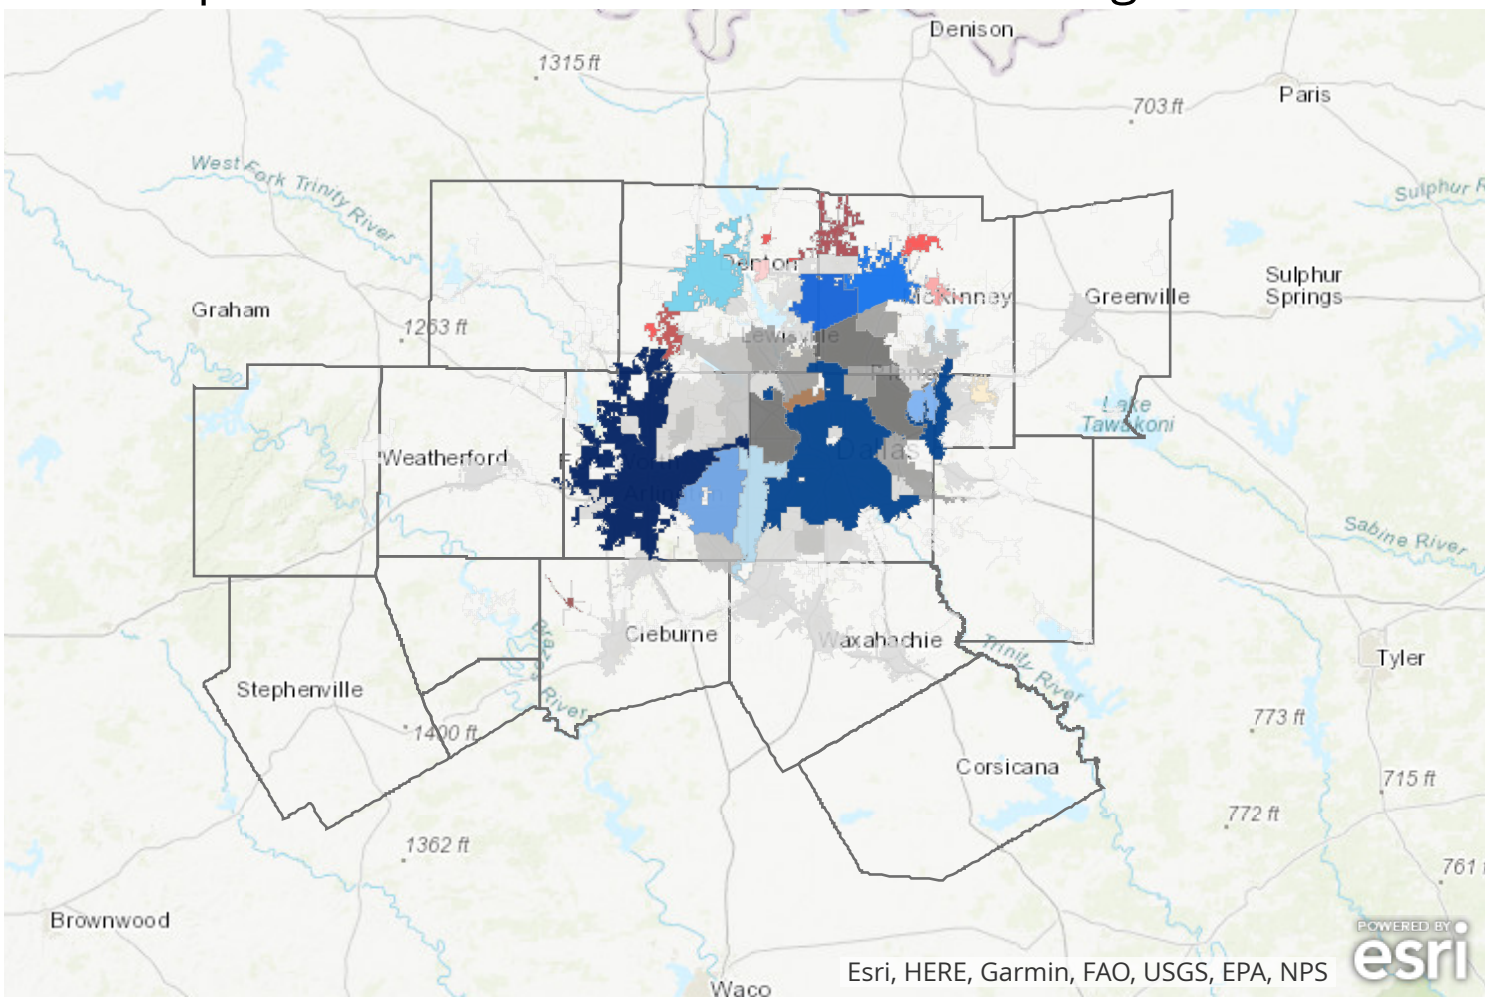

August 25, 2020

The North Central Texas Council of Governments (NCTCOG), as the designated water quality planning agency for the North Central Texas area, is responsible for developing the regional Water Quality Management Plan (WQMP).

Since developing the first WQMP in 1975, the NCTCOG 16-county region has grown by 4.97 million people. The historical population growth and projected growth has required and will continue to require water resources planning to address water quality, wastewater capacity, and water supply needs. The WQMP provides data and information regarding potential needs and priorities for improving water quality and continuing regional efforts to meet wastewater capacity needs for the expanding population.

The NCTCOG region is composed of over 330 sub-watersheds that include a myriad of diverse land uses working to support the growing population of the NCTCOG region (see map on right). Entities across North Texas work to maintain and improve water resources with the development of management plans to meet future needs.

NCTCOG Counties

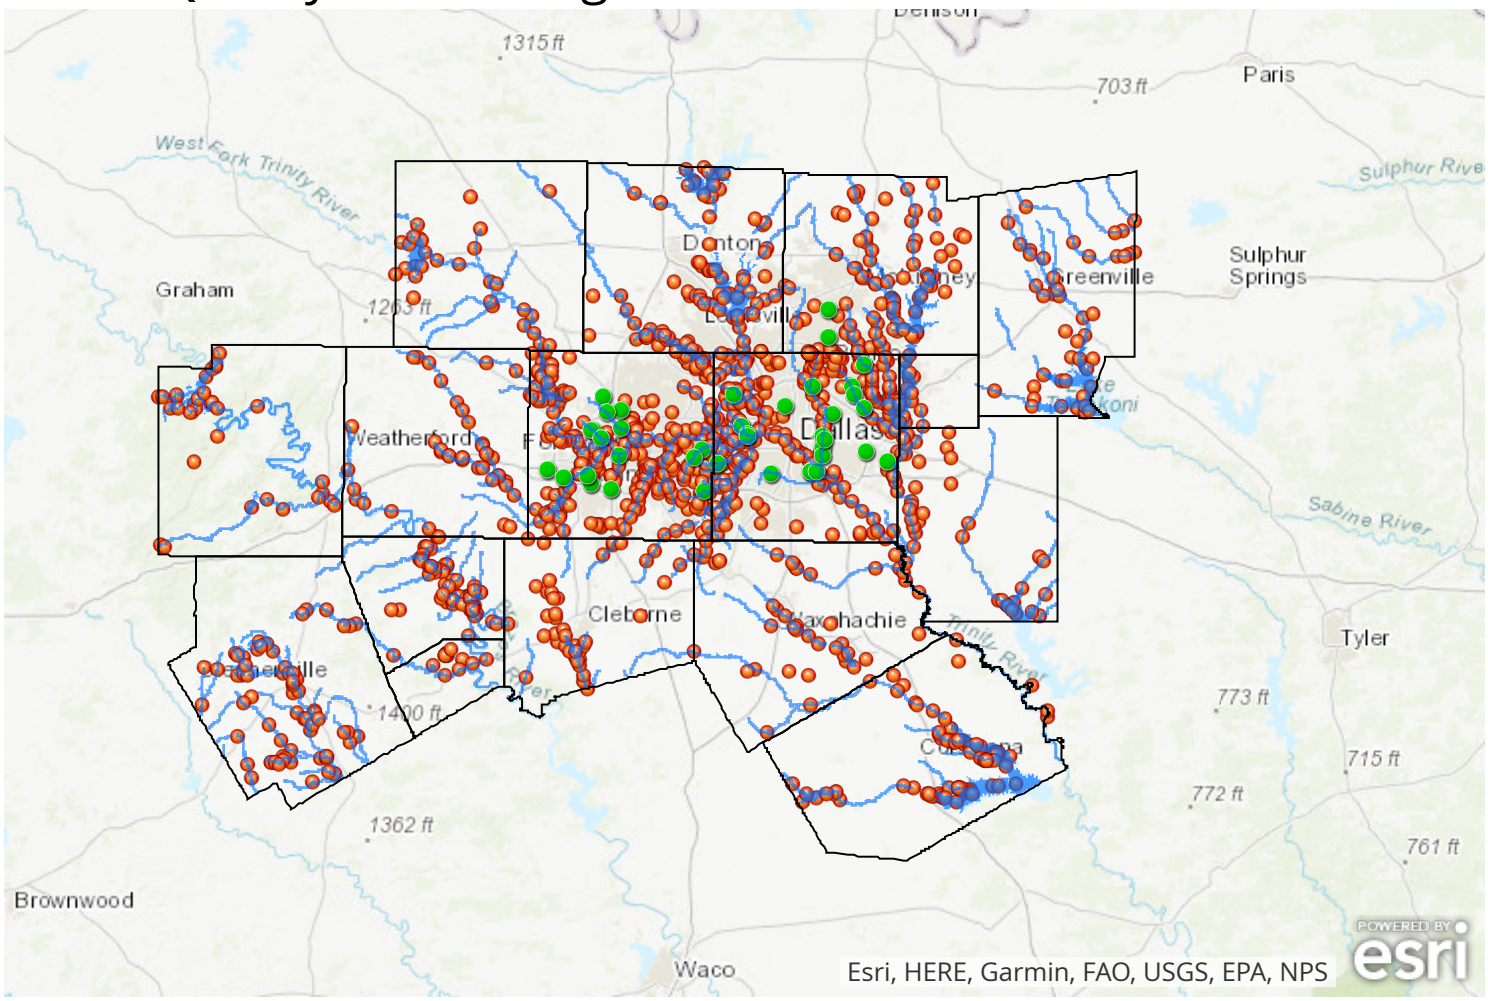

The 16-county NCTCOG region continues to experience population growth. The figure **here** shows the high levels of population growth in the Dallas-Fort Worth region from 2010 to 2020. Forecasts project this trend will continue through 2045. The continual growth in the region is important to agencies tasked with maintaining or improving water quality, providing adequate capacity for wastewater treatment, and ensuring sufficient drinking water supplies.

Several methods of growth analysis are used to establish existing and projected growth trends in the North Central Texas region. NCTCOG produces annual population estimates and, in 2017, population and employment projections for 2045 for the 12-county Metropolitan Planning Area (MPA), which can be found **here**. The projected population data provides a uniform base for infrastructure planning and resource allocation in the MPA. The Texas Water Development Board (TWDB) also produces population projections, which NCTCOG uses to measure population.

The NCTCOG region experiences considerable annual population change. Analysis of where existing growth is occurring within the region is important to understand growth patterns to assist with future planning needs. To assist with this effort, a list of NCTCOG city population estimates for 2010 - 2020 can be found **here**. Additionally, the map on the right shows the top ten cities with the highest percent change (red) and largest absolute growth (blue). Percent change in population shows the relative change in size of a population from 2019 to 2020, and tends to occur in smaller cities. Absolute growth indicates the actual number of people the population increased (or decreased) by from 2019 to 2020. The absolute growth and percent change growth values for the top ten cities can be seen in a tabular format **here**.

The map also shows that the four core counties - Collin, Dallas, Denton, and Tarrant Counties - are experiencing a significant population growth compared to the rest of the NCTCOG region. These counties are responsible for an estimated 83 percent of the population growth in 2020 and will continue to increase in population through 2045, according to the NCTCOG RIS 2045 population projections. Actual values can be found in the table **here**.

Water Quality Monitoring in North Central Texas

NCTCOG Counties

Lakes

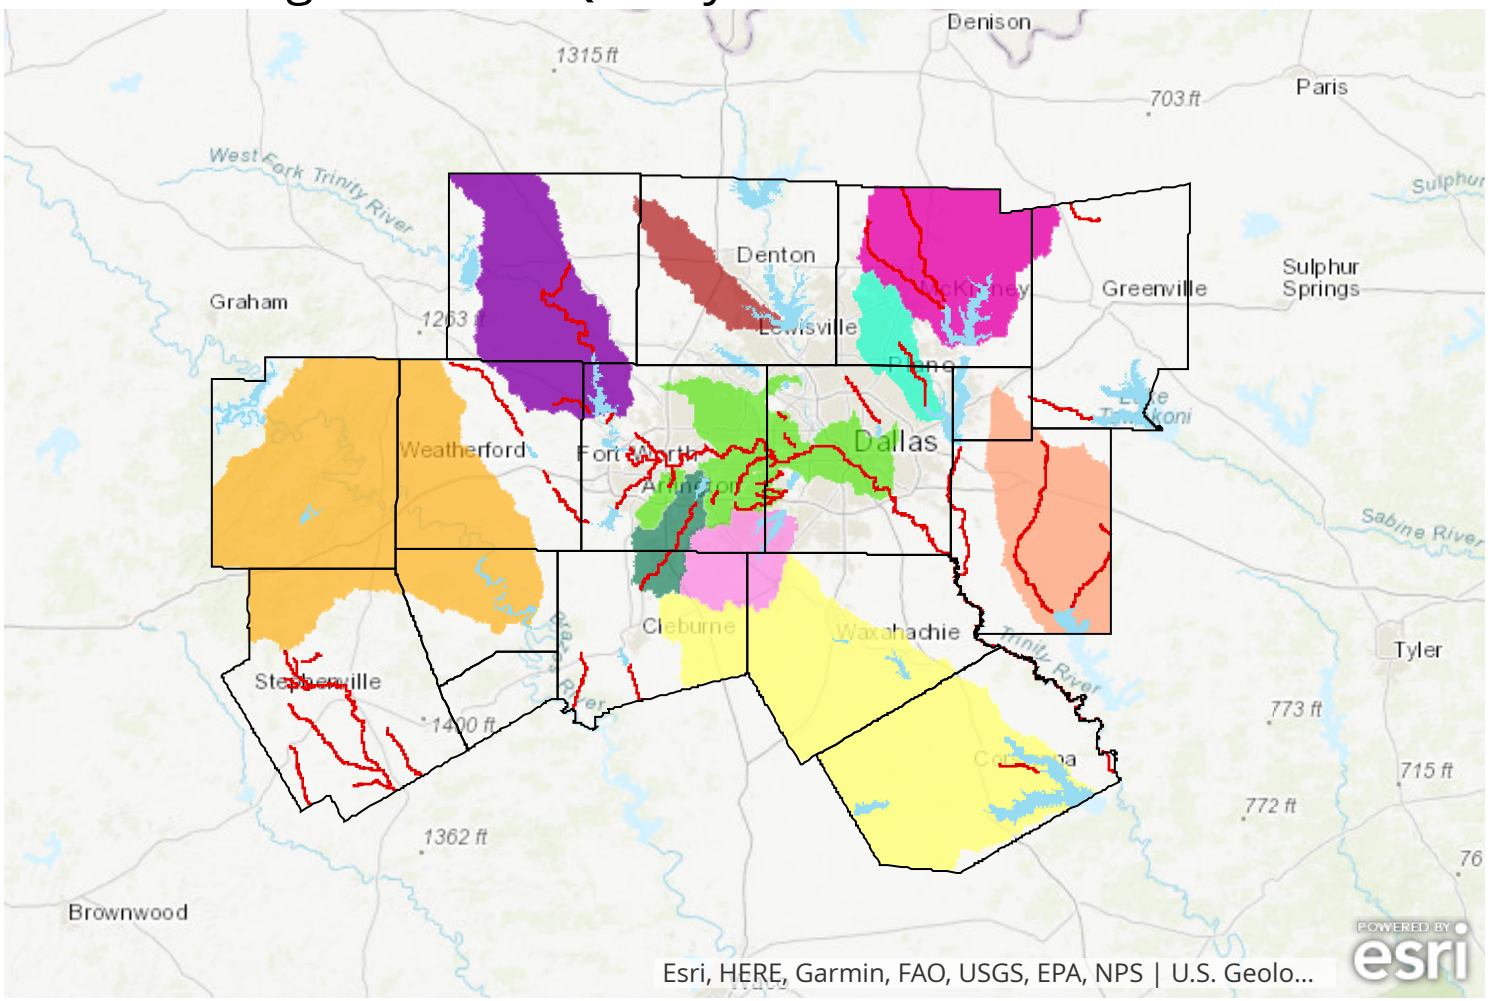

TCEQ Surface Water Quality Monitoring Sites

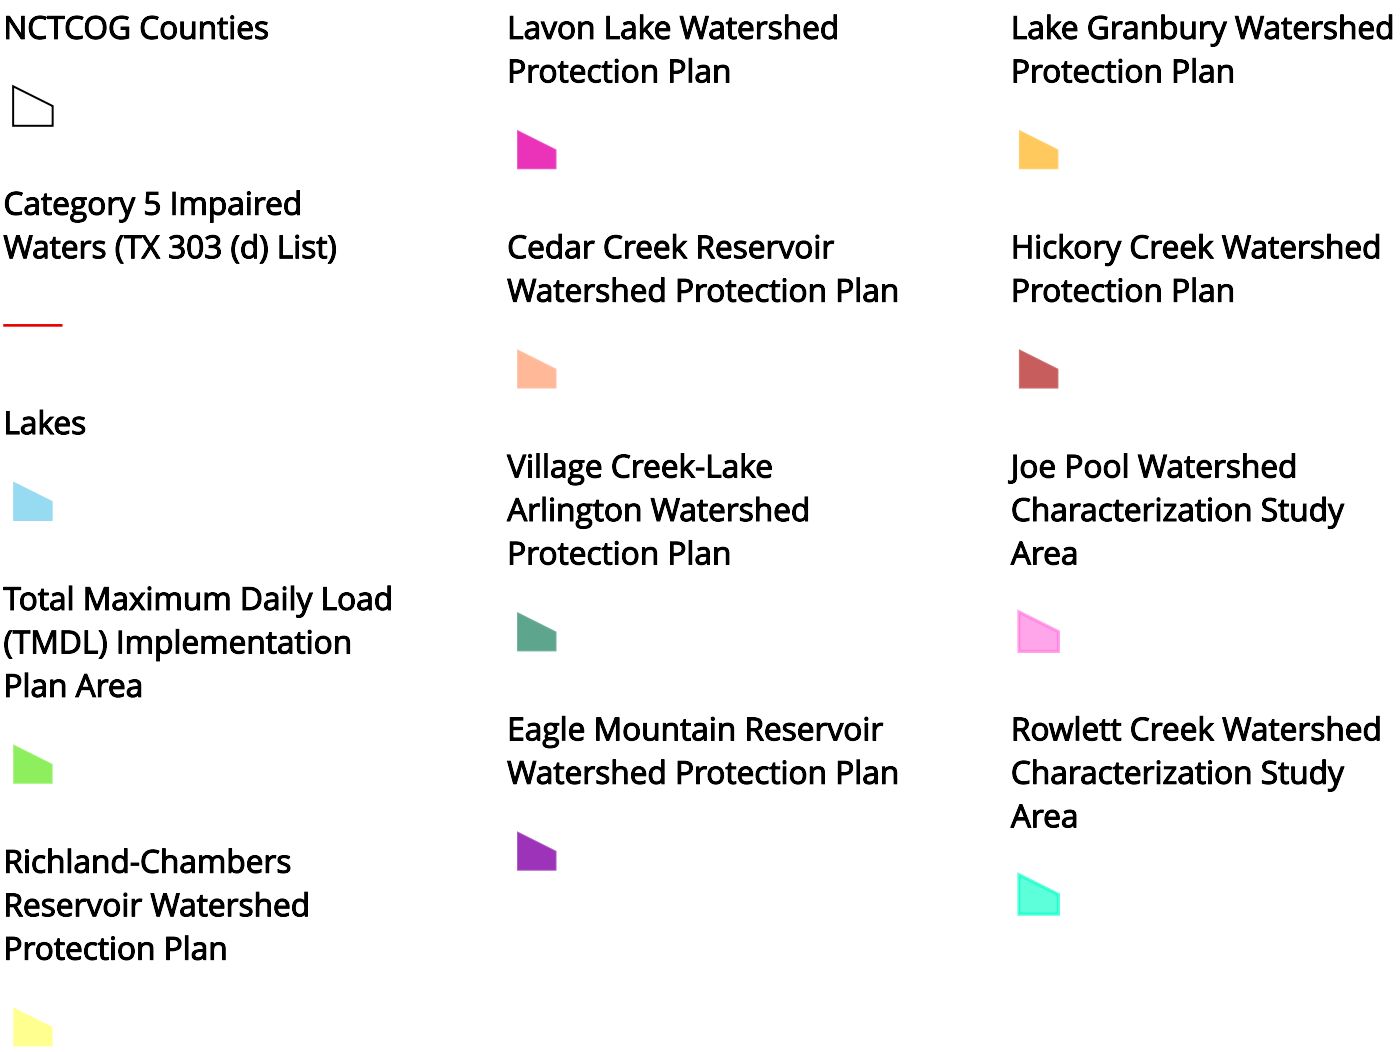

Major waterways

NCTCOG Regional Stormwater Monitoring Sites

The North Central Texas region has an extensive network for water quality monitoring, which is supported by state and local governments as well as citizen scientists. NCTCOG has gathered data on the water quality monitoring activities occurring in the region to provide a more complete view of efforts being implemented to improve or maintain water quality. The map shows Texas Commission on Environmental Quality's Surface Water Quality Monitoring stations in orange along with the sites currently monitored in association with NCTCOG's Regional Stormwater Monitoring Program in green.

NCTCOG Region Water Quality Overview

NOTE: All the water quality data in this interactive mapping tool is from the [2018 Texas Integrated Report of Surface Water Quality], which was approved by U.S. Environmental Protection Agency (U.S. EPA) on December 23, 2019. This was the most recent data available at the time this report was drafted.

The water quality in the NCTCOG region is important to the health, safety, and welfare of residents, ecosystems, and long term economic growth. Texas Commission on Environmental Quality (TCEQ) administers the water quality standards for Texas and assigns a category of 1 through 5 to a water body based on its attainment of the water quality standards. Categories 4 and 5 include all the waters that are "impaired," meaning they are not attaining the water quality standard. TCEQ defines the categories 4 and 5 as follows:

- Category 4 includes impaired waters for which TMDLs (Total Maximum Daily Loads) have already been adopted or for which other management strategies are underway to improve water quality, and
- Category 5 includes impaired waters for which TMDLs or other management strategies are planned. This category is also known as the Texas 303(d) List. [1]

A TMDL establishes the amount of pollutant that a stream segment can receive and still maintain the water quality standards for its designated use. It is used as a planning tool for restoring water quality in a specific area. Another planning tool to restore water quality is a **Watershed Protection Plan** (WPP). WPPs address nonpoint source pollution in a watershed through the consensus of stakeholders on strategies. They are mostly funded through TCEQ, Texas State Soil and Water Conservation Board, and U.S. EPA, but can also be funded from local sources. The TMDL implementation plan and WPP areas in the NCTCOG region are discussed in more detail in the next two sections of this report. The boundaries of these planning areas are shown on the map with the TMDL boundary shown in green near the center.

According to TCEQ's 2018 Texas Integrated Report of Surface Water Quality, the NCTCOG region has 48 water segments and 5 lakes/reservoirs that are considered "impaired," meaning they fall in either category 4 or 5. Of these 48 segments, 36 segments, along with the 5 lakes/reservoirs, fall in category 5 and are on the Texas 303(d) List. The map on the right displays the 2018 Texas 303(d) List of impaired surface water segments and lakes/reservoirs in red. The dark blue water segments show the category 4 segments.

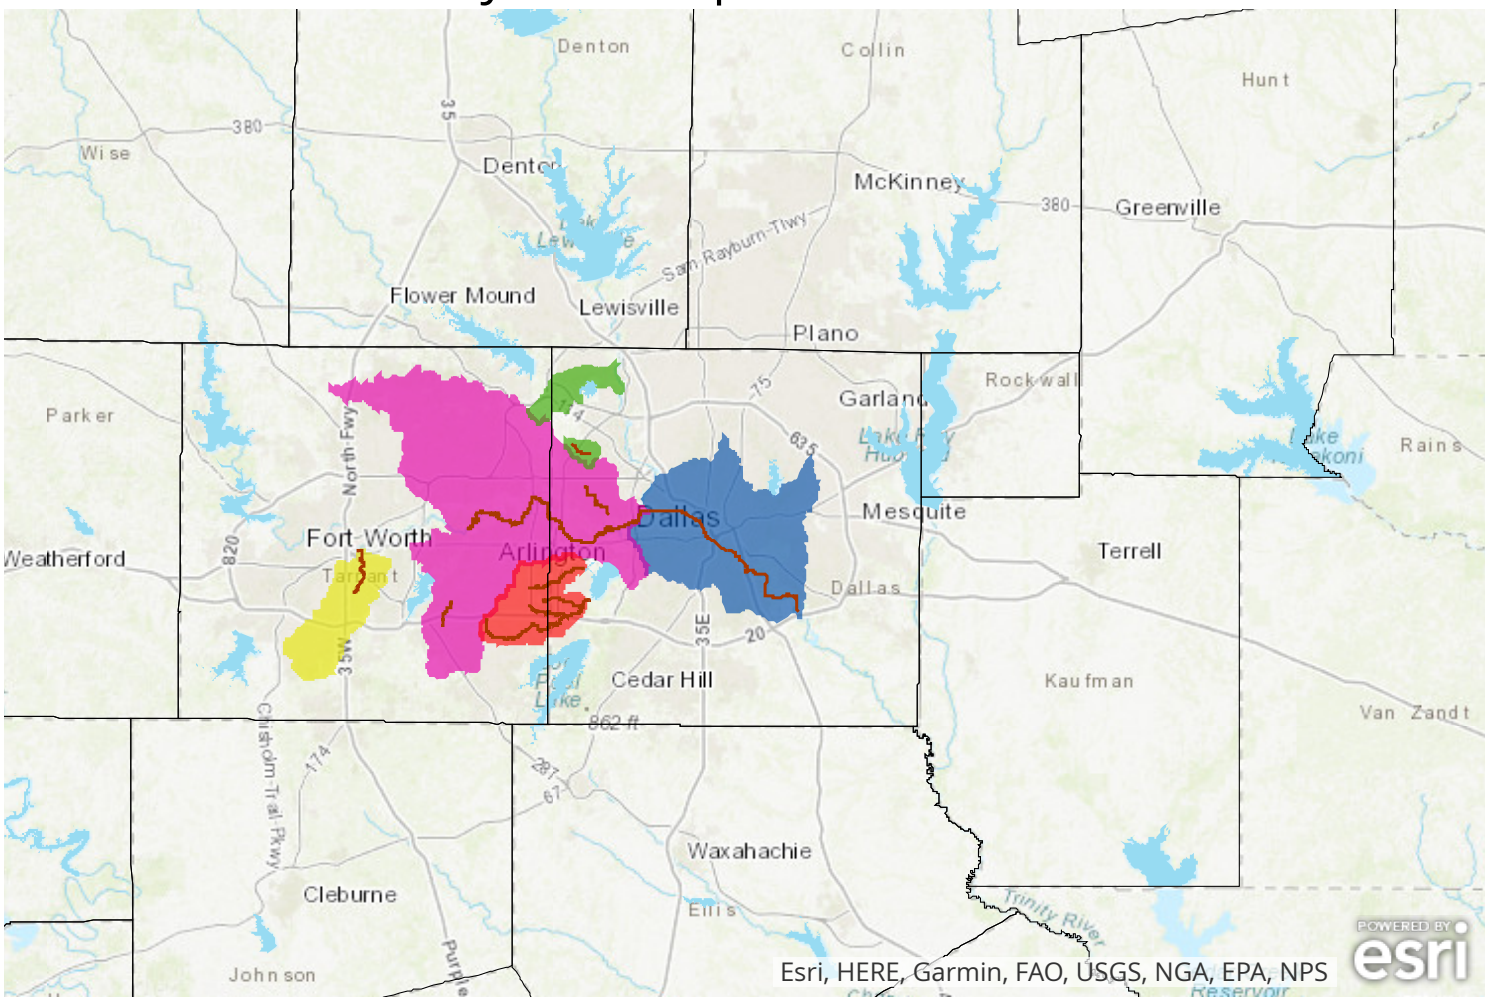

NCTCOG and entities across the region actively engage in pollution prevention strategies to reduce the amount of pollution entering into the regional waterways. These activities help improve the water quality throughout the region and support efforts that work towards removing water bodies from the Texas 303(d) List. Such strategies include:

- Municipal Separate Storm Sewer (MS4) operators (such as cities and transit authorities) are required to reduce pollution that could contaminate stormwater and run off into local waterways. NCTCOG coordinates the **Regional Stormwater Management Program** to engage MS4s in regional efforts to achieve the permit requirements for their individual permits.
- Entities throughout North Texas have begun the development and implementation of WPPs in an effort to improve and prevent water quality pollution.
- Entities throughout North Texas participate in the **TMDL Implementation Plan Program**, which aims to reduce the amount of bacteria entering into the Greater Trinity River and some of its tributaries through the implementation of water quality improvement strategies.
- There are seven WPPs currently under development or implementation in the NCTCOG region, plus two Watershed Characterization studies that collect data unique to the watershed so that a WPP can then be developed. WPPs are designed to prevent, reduce, or manage nonpoint source water pollution.
- Volunteer organizations, such as the **Texas Stream Team**, coordinate with citizens to monitor water quality to provide cities and other entities

supplemental information to help recognize waterways being impacted by pollution.

Total Maximum Daily Load Implementation Plan

NCTCOG Counties

Lakes

Impaired Water Segments in TMDL Boundary (from 2018 Texas Integrated Report)

Cottonwood Branch and Grapevine Creek TMDL

Sycamore Creek TMDL

Mountain Creek TMDL

Lower West Fork TMDL

Upper Trinity TMDL

NCTCOG supports the development and implementation of the Total Maximum Daily Load (TMDL) Implementation Plan (I-Plan) to address bacteria levels in the Greater Trinity River Region. TMDL boundaries in the NCTCOG region are shown on the map. A TMDL

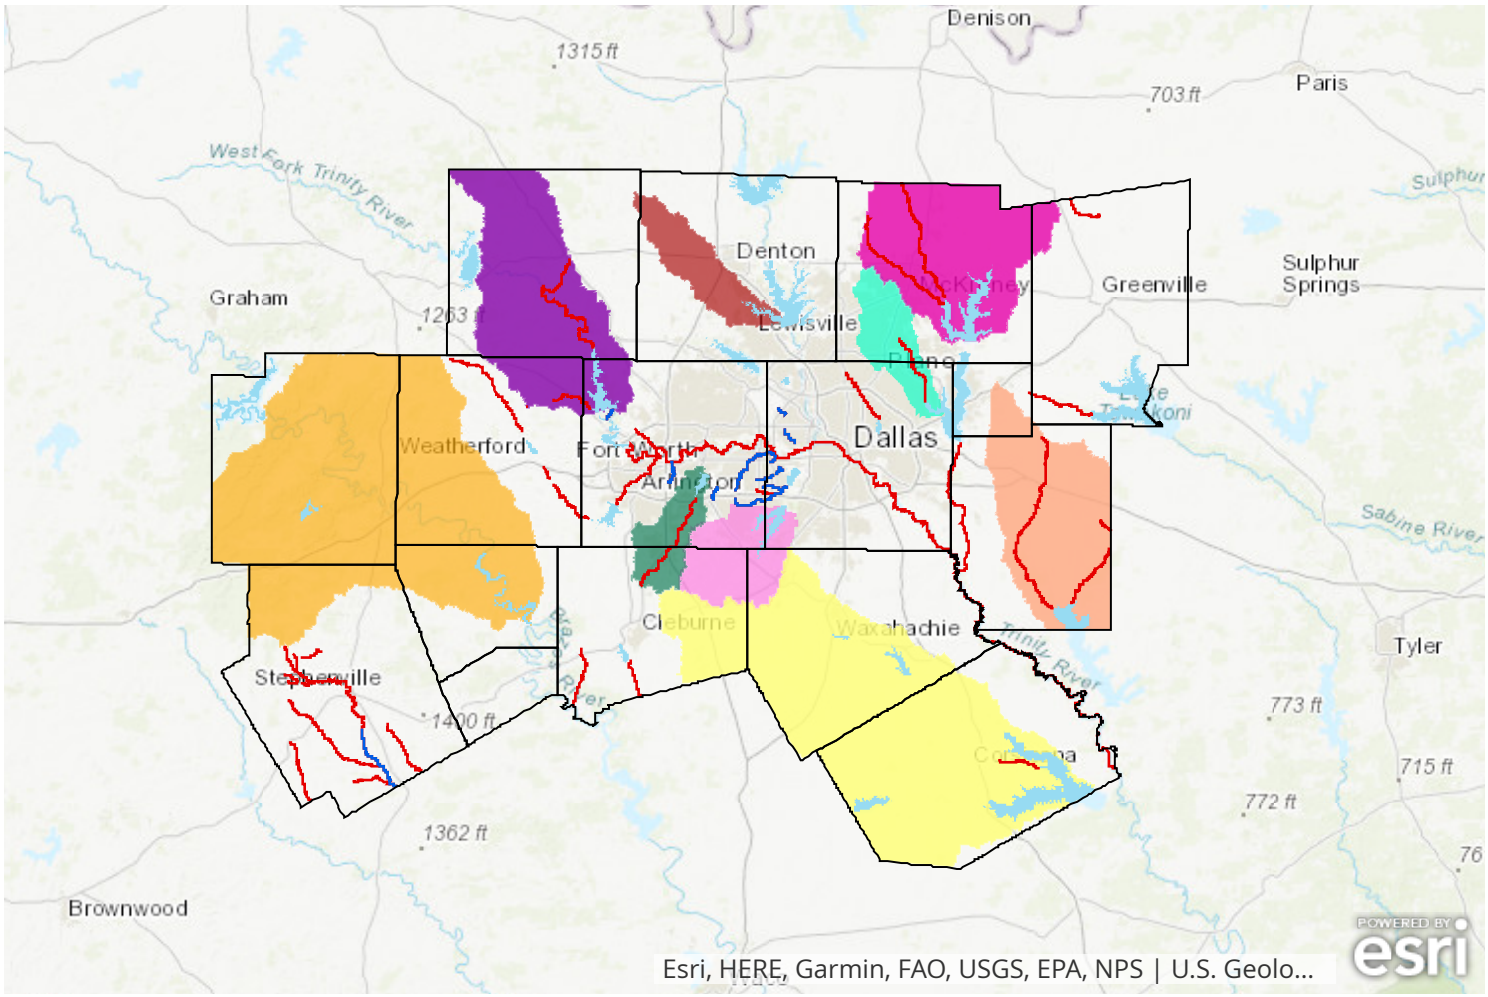

establishes the amount of pollutant that a stream segment can receive and still maintain the water quality standards for its designated use.

The I-Plan was approved by TCEQ Commissioners in 2013 and initially included 17 TMDLs. It was updated in 2017 to include an additional 4 TMDLs, and again in 2019 to include an additional TMDL for Sycamore Creek. The I-Plan describes strategies that can be taken to reduce the levels of bacteria loading in portions of the Trinity River and its tributaries that are listed as impaired for bacteria in the Texas Integrated Report Index of Water Quality Impairments (which includes the 303(d) List). The I-Plan has outlined implementation strategies to reduce bacteria loading in the following waterways:

- Upper Trinity River (Segment 0805, upper end)
- Elm Fork Trinity River tributaries of Cottonwood Branch and Grapevine Creek (Segments 0822A and 0822B)
- Lower West Fork Trinity River (Segment 0841) and 11 of its tributaries
- Tributaries of Mountain Creek Lake (Segments 0841F, 0841K, 0841N, and 0841V)
- Sycamore Creek (Segment 0806E)

The efforts underway since the inception of the TMDL I-Plan have been outlined in the first Annual TMDL Program Summary. To view the TMDL I-Plan and the TMDL Annual Program Summary, visit **www.nctcog.org/TMDL**.

Watershed Protection Plans

NCTCOG Counties

Category 4 Impaired Waters

Category 5 Impaired Waters (TX 303 (d) List)

Richland-Chambers Reservoir Watershed Protection Plan

Lavon Lake Watershed Protection Plan

Cedar Creek Reservoir Watershed Protection Plan

Village Creek-Lake Arlington Watershed Protection Plan

Eagle Mountain Reservoir Watershed Protection Plan

Lake Granbury Watershed Protection Plan

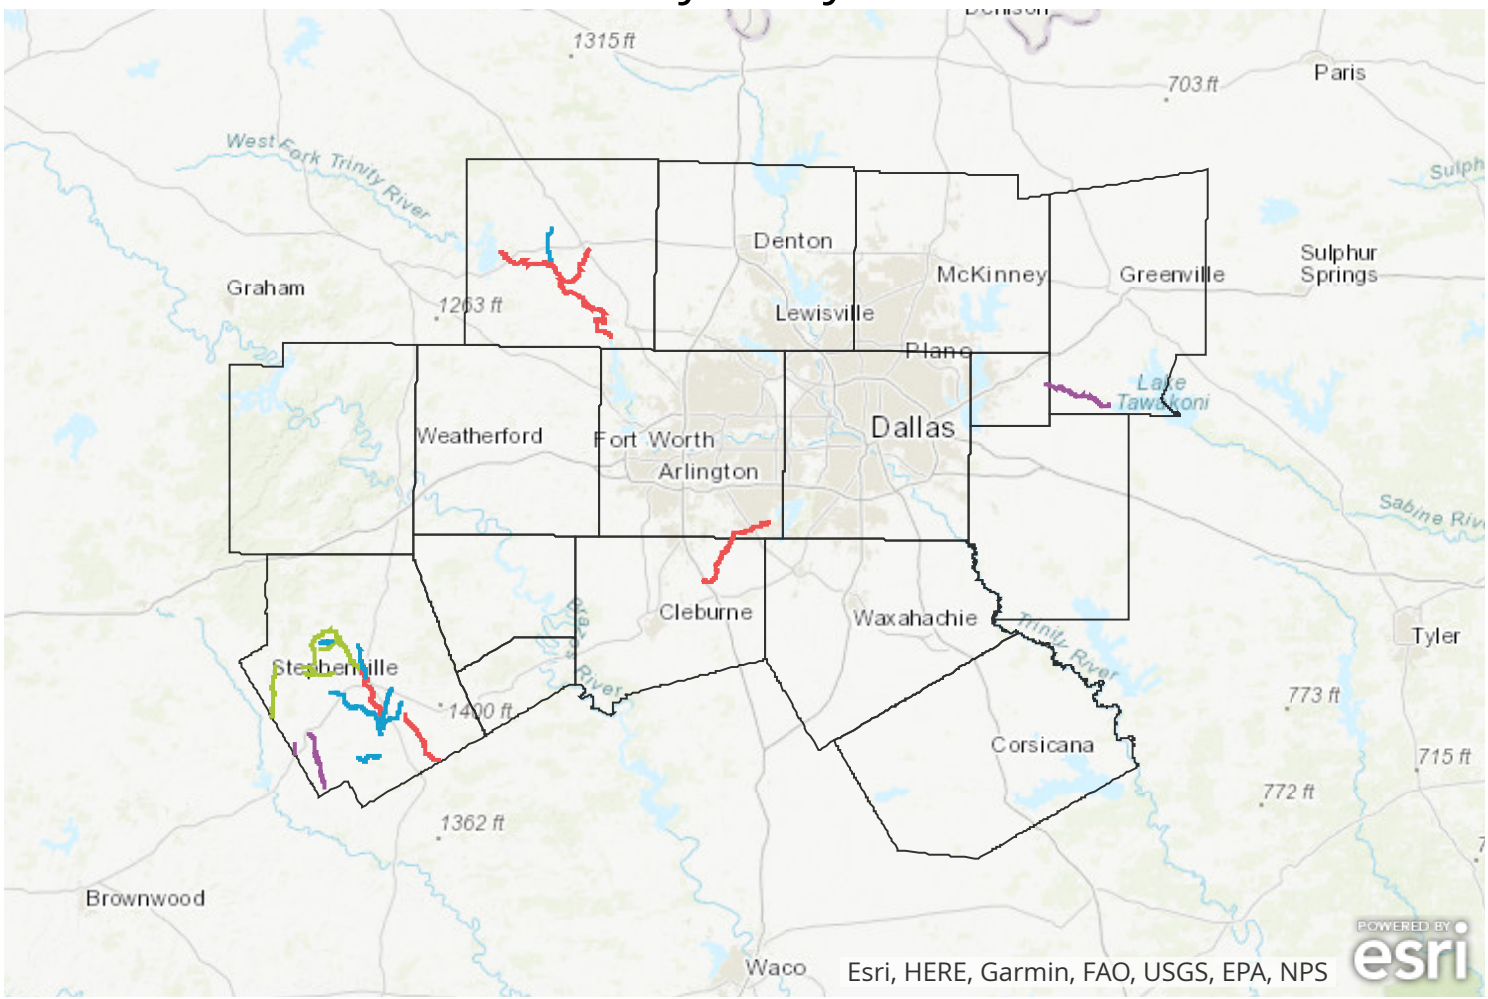

Hickory Creek Watershed Protection Plan

Joe Pool Watershed Characterization Study Area

Rowlett Creek Watershed Characterization Study Area

A Watershed Protection Plan (WPP) is a coordinated framework for implementing water quality protection and restoration strategies within a watershed. WPPs holistically address all the sources and causes of impairment to both surface and groundwater resources. Developed and implemented through a diverse, well-integrated partnership of stakeholders, a WPP assures the long-term health of the watershed and is one of the ways that entities in the NCTCOG region are helping with pollution prevention efforts. As the map shows, there are seven watershed protection plans under development or implementation in the region. The status of each WPP in the region, as of March 2020, can be seen in a table **here**. Additionally, there are two Watershed Characterization (WC) studies underway in the region, Joe Pool Lake and Rowlett Creek. These studies include the collection and analysis of water quality data for a watershed and are considered a first step toward developing a WPP.

Recreational Use Attainability Analysis Studies

RUAAs for NCTCOG Waterbodies

- Retained designated use of Primary Contact Recreation
- Pending
- Revised to a designated use to Secondary Contact Recreation 1
- Revised to a designated use to Secondary Contact Recreation 2

NCTCOG Counties

Texas Commission on Environmental Quality (TCEQ) is responsible for establishing and enforcing water quality standards for Texas waterways and employs several tools to define appropriate water quality standards for each stream segment across Texas. One tool, the Use Attainability Analysis (UAA), reevaluates the designated (or presumed) use of a water body. A UAA would be performed if a water body's water quality standard is questioned as appropriate for local conditions. Analysis of use is based on the physical and flow characteristics of the stream; supporting information from individuals and

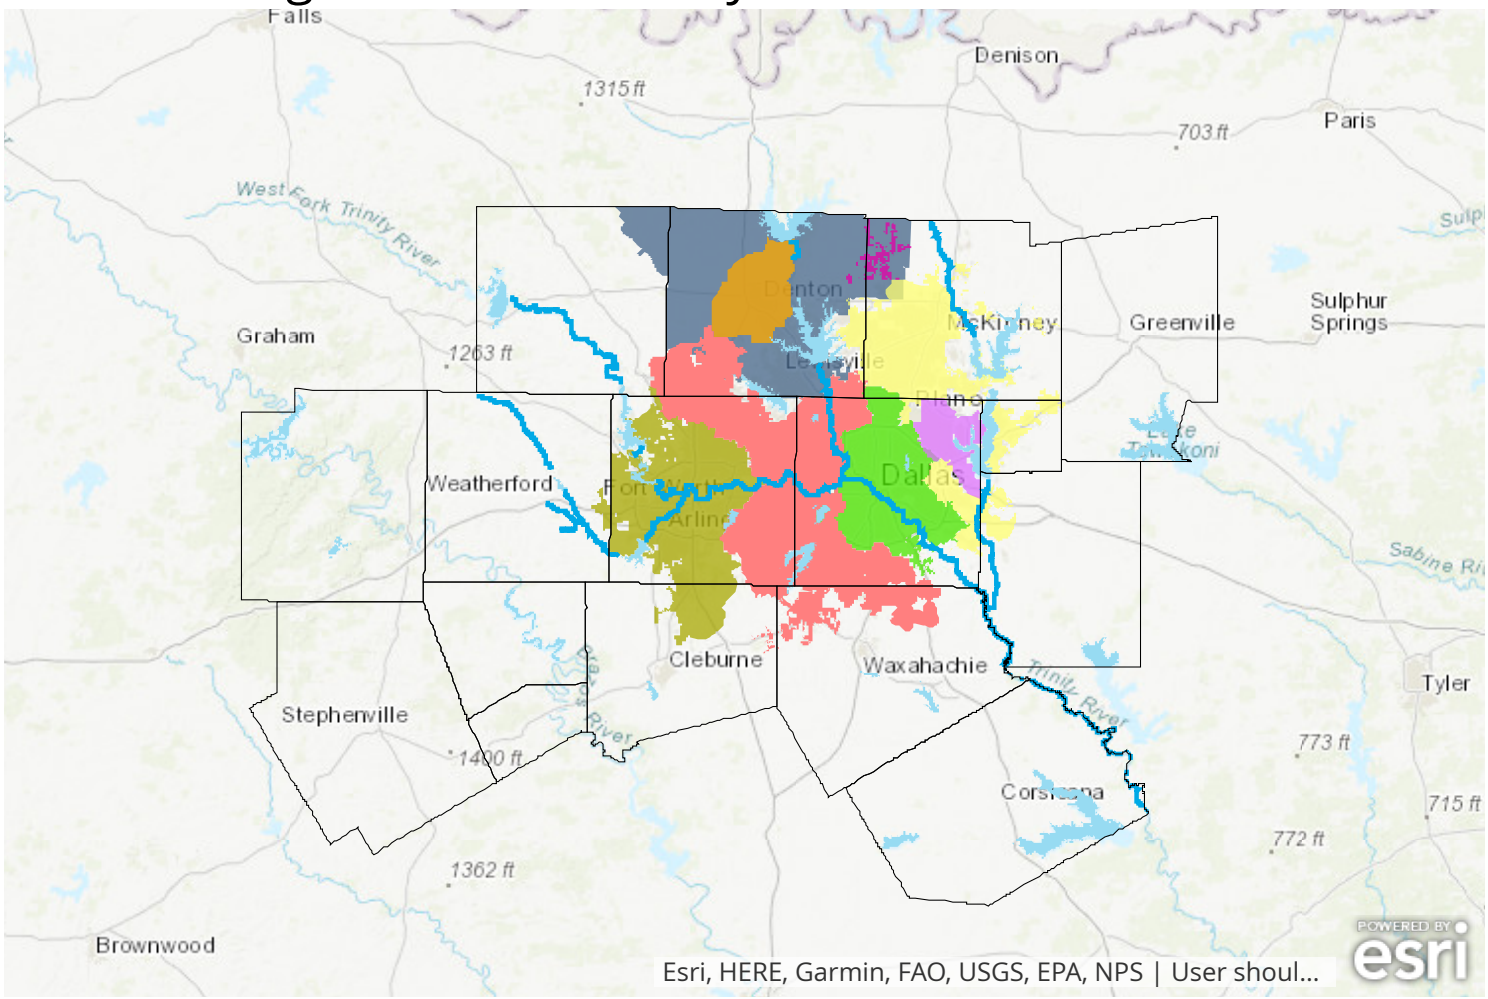

organizations with firsthand knowledge; and historical and existing patterns of use (TCEQ, 2016).

The most common UAA is the Recreational Use-Attainability Analysis (RUAA), which determines what category of recreational use is appropriate for a particular water body. There are four categories:

Primary Contact Recreation: Activities that are presumed to involve significant risk of ingestion of water
Secondary Contact Recreation 1: Activities that commonly occur but have limited body contact, incidental to shoreline activity
Secondary Contact Recreation 2: Activities with limited body contact, incidental to shoreline activity
Non-contact Recreation: Activities that do not involve a significant risk of water ingestion, such as those with limited body contact, incidental to shoreline activity.

RUAA studies within the NCTCOG Region, as of March 2020, are highlighted on the map and shown in the table **here**. Performing a RUAA has the potential to change the designated water quality standard of a waterway, which could cause a waterway to achieve attainment for certain pollutants, and no longer be considered impaired. Stream segments with pending outcomes are still awaiting EPA approval of TCEQ recommendations.

Ensuring adequate capacity to treat wastewater from new residential and commercial development in addition to the existing residents and businesses is a long-term planning

need in the NCTCOG region. Wastewater service providers monitor growth trends to ensure their systems address issues such as plant expansions or new infrastructure that might be needed to meet future wastewater demands. Furthermore, several communities in the region have invested in wastewater infrastructure over the past year to upgrade or build new wastewater treatment facilities to treat increasing amounts of wastewater.

Communities located on the perimeter of the urbanized area and rural communities may become more dependent on each other to partner, or engage in existing partnerships, to provide cost efficient wastewater services. For such a densely populated and growing region, the need for adequate treatment services is a crucial component to protecting water quality and is a priority to the seven wastewater joint system providers and individual wastewater system operators. The joint system providers in the region serve many local governments as members or customers. The Water Resources Council recommends that regional wastewater system providers aim to incorporate new entities into the existing systems, rather than have new systems operate independently. Service areas of wastewater systems, as seen on the map, can serve as an indicator of the expanding wastewater capacity within the region.

Lakes Receiving Discharge

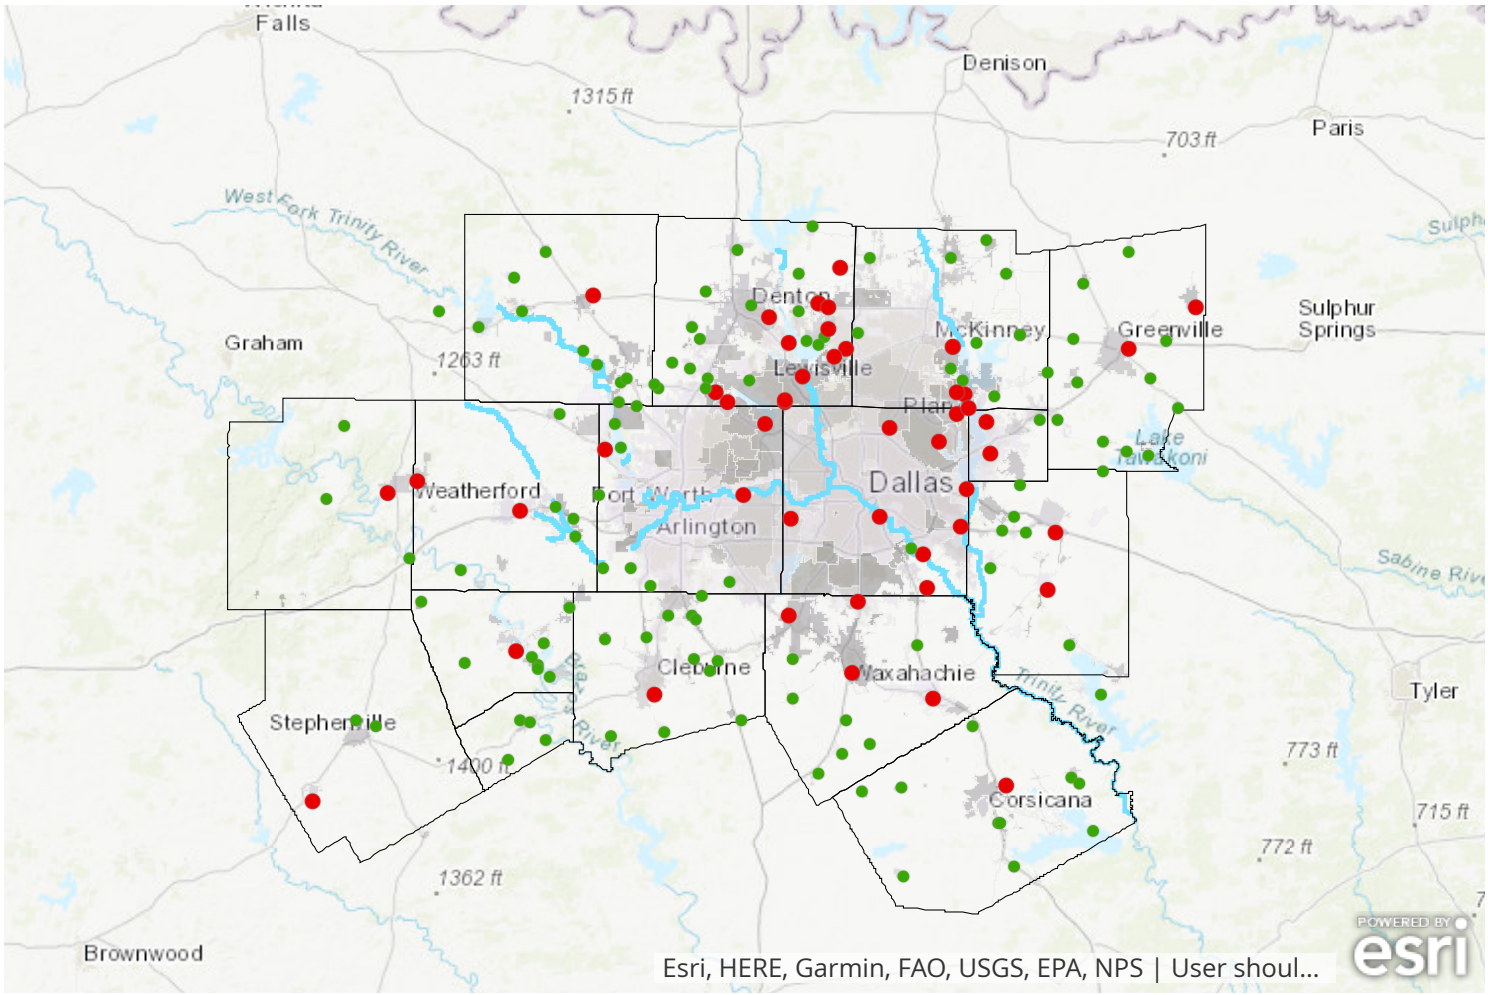

Local, state, and federal regulations require pretreatment programs as part of the National Pollutant Discharge Elimination System (NPDES), which is administered at the state level by TCEQ's Texas Pollutant Discharge Elimination System (TPDES) program. The TPDES program controls water pollution by regulating point sources that discharge pollutants into waterways. Any industrial, municipal, or other facility must obtain a TPDES permit if their discharge goes directly into surface waters. This includes but is not limited to wastewater treatment plants.

NCTCOG developed a database of TPDES permits, compiling permit renewals and major and minor amendments occurring in the NCTCOG Region. The database maintains records for each permit, providing pertinent information, including: permit applicant; permit location; any permit modifications; permitted flow (gallons per day); and the outfall path of the permitted discharge. The map on the right shows the most recent iteration of received TPDES wastewater permits, color coding them to the water body receiving the permitted discharge.

The map provides a snapshot of new, amended, or renewed permitted dischargers within the region from 2019 to March 2020. This information can be used in planning for future capacity and help identify priority water bodies or watersheds that may need preventative action in order to maintain designated water quality standards.

For more information about each TPDES permit and waterway receiving the discharge, click on the map. For a table of each TPDES permit on the map, refer to the TPDES database **here**.

NCTCOG Wastewater Treatment Plants

Wastewater Treatment Plants

- Minor
- Major

NCTCOG Counties

Trinity River

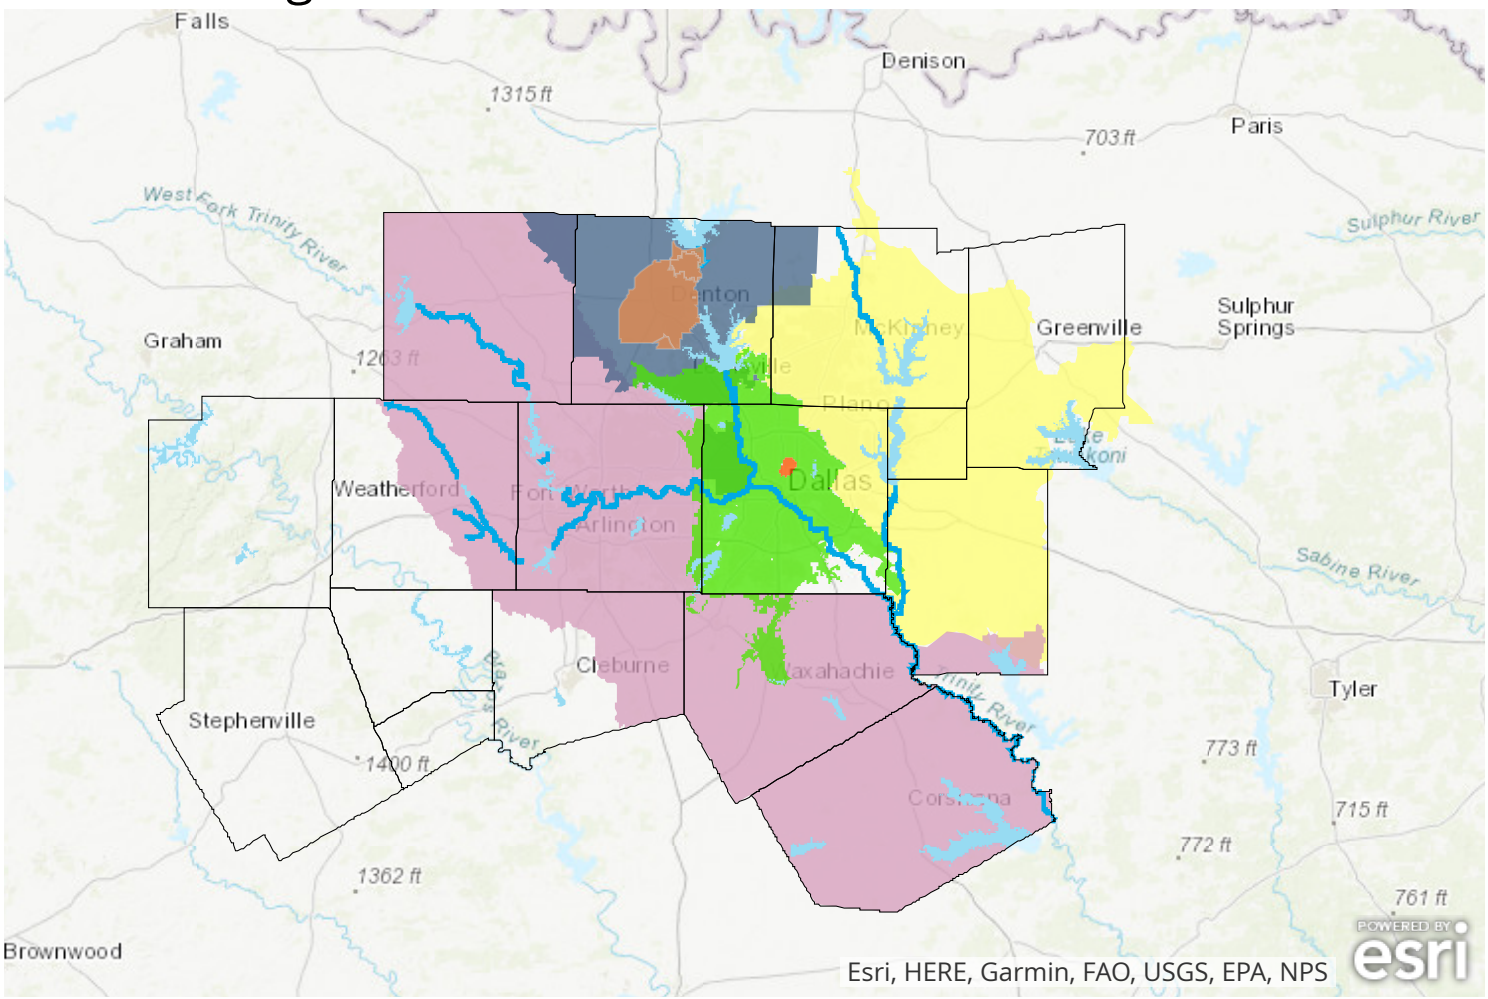

Wastewater service providers operate wastewater treatment plants (WWTPs) as a part of the wastewater system. WWTPs are regulated by TCEQ and are required to acquire Texas Pollutant Discharge Elimination System (TPDES) permits for discharges to receiving water bodies. The permit limits are set by the state to avoid pollutant overloads to surface waters.

The TPDES program helps to control discharges of pollutants into surface waters. Every TPDES permittee must submit monthly Discharge Monitoring Reports (DMR) to TCEQ, which can be used to assess the yearly wastewater discharge of individual WWTPs. There are 111 minor and 44 major WWTPs in the NCTCOG region. WWTPs are designated as minor when the design flow is less than or equal to 1 million gallons per day (MGD).

The largest design flow values are found within the urbanized Dallas and Tarrant County area.

Click on a wastewater facility on the map to view the facility's name and annual discharge rate, which was calculated by NCTCOG using monthly DMR data obtained from TCEQ for the year 2018 (January 2018 – December 2018). Monthly DMR data obtained from TCEQ for the NCTCOG region for 2019, is available for download **here** as a zip file.

NCTCOG Region Water Service Areas

NCTCOG Counties

City of Denton

Trinity River

Lakes

Park Cities Municipal Utility District (MUD)

Dallas Water Utilities Water Services

Upper Trinity Regional Water District Water Services

Tarrant Regional Water District Water Services

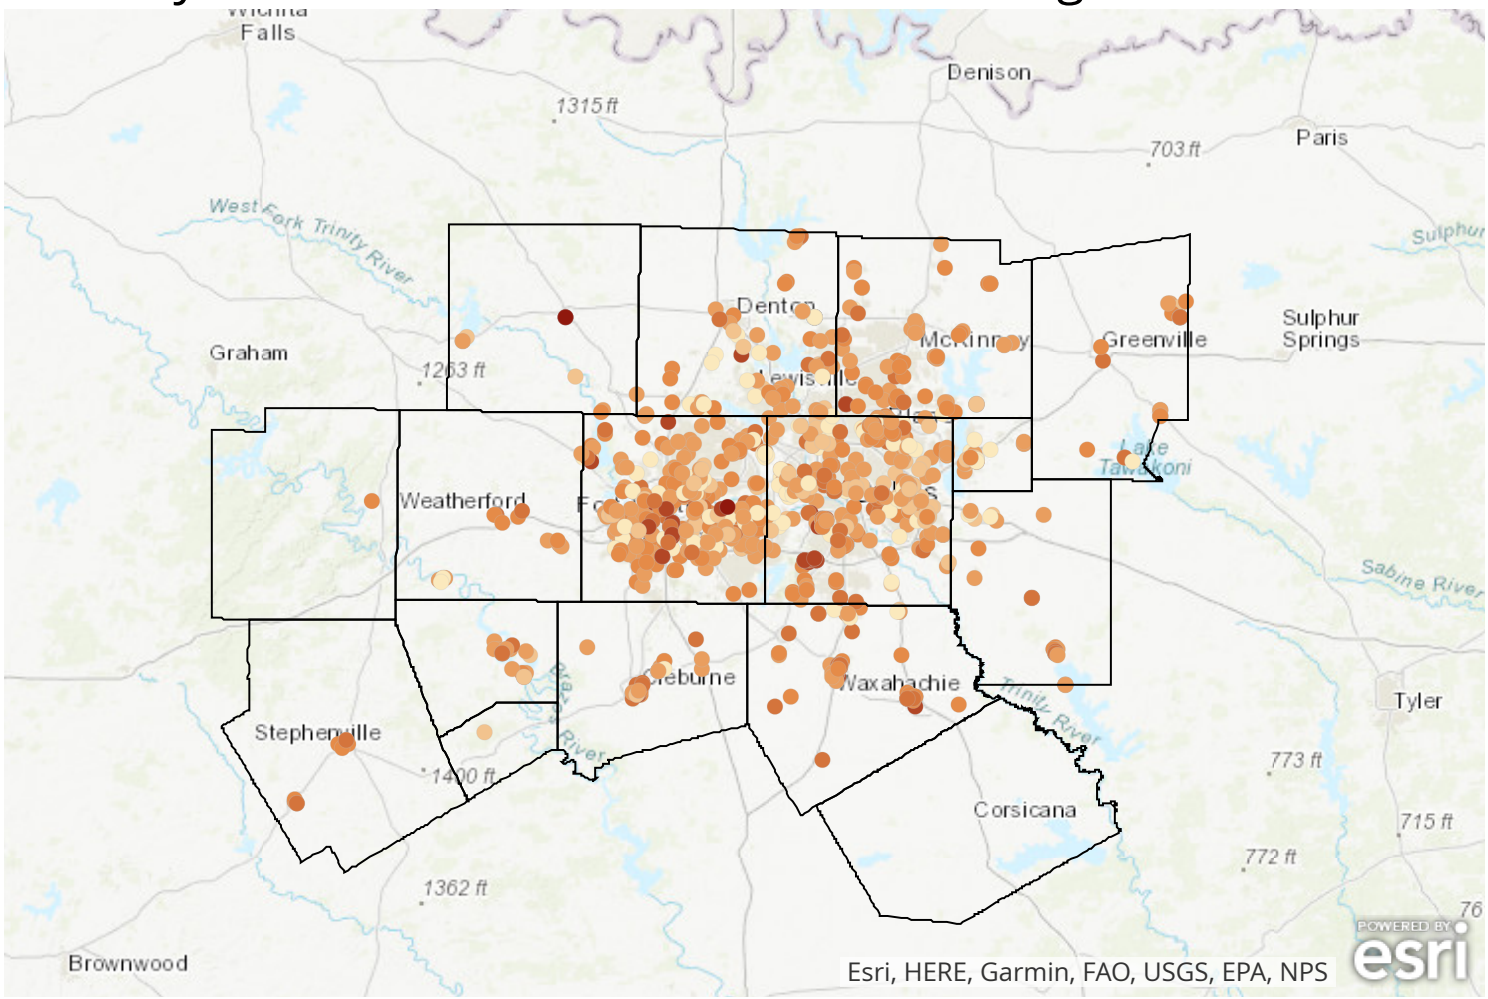

North Texas Municipal Water District Water Services

A water district is a local, governmental entity that provides limited services to its customers and residents. Water districts are created when a group of cities and utilities

come together for the purpose of planning water use on a multi-community basis. Water districts help to plan for current and future water use by collecting funds and allocating capital for water related infrastructure projects within the region.

The map shows the major water providers in the NCTCOG region and the areas served with a diverse set of water needs and services. The cooperation of multiple cities and utilities on the water districts board help to facilitate compliance with water, wastewater, and reclaimed water.

Sanitary Sewer Overflows in the NCTCOG Region

NCTCOG Counties

2019 Sanitary Sewer Overflows (gallons)

Amount_No

- > 1,000,000
- > 100,000 – 1,000,000
- > 10,000 – 100,000
- > 1,000 – 10,000
- > 100 – 1,000
- > 50 – 100
- 1 – 50

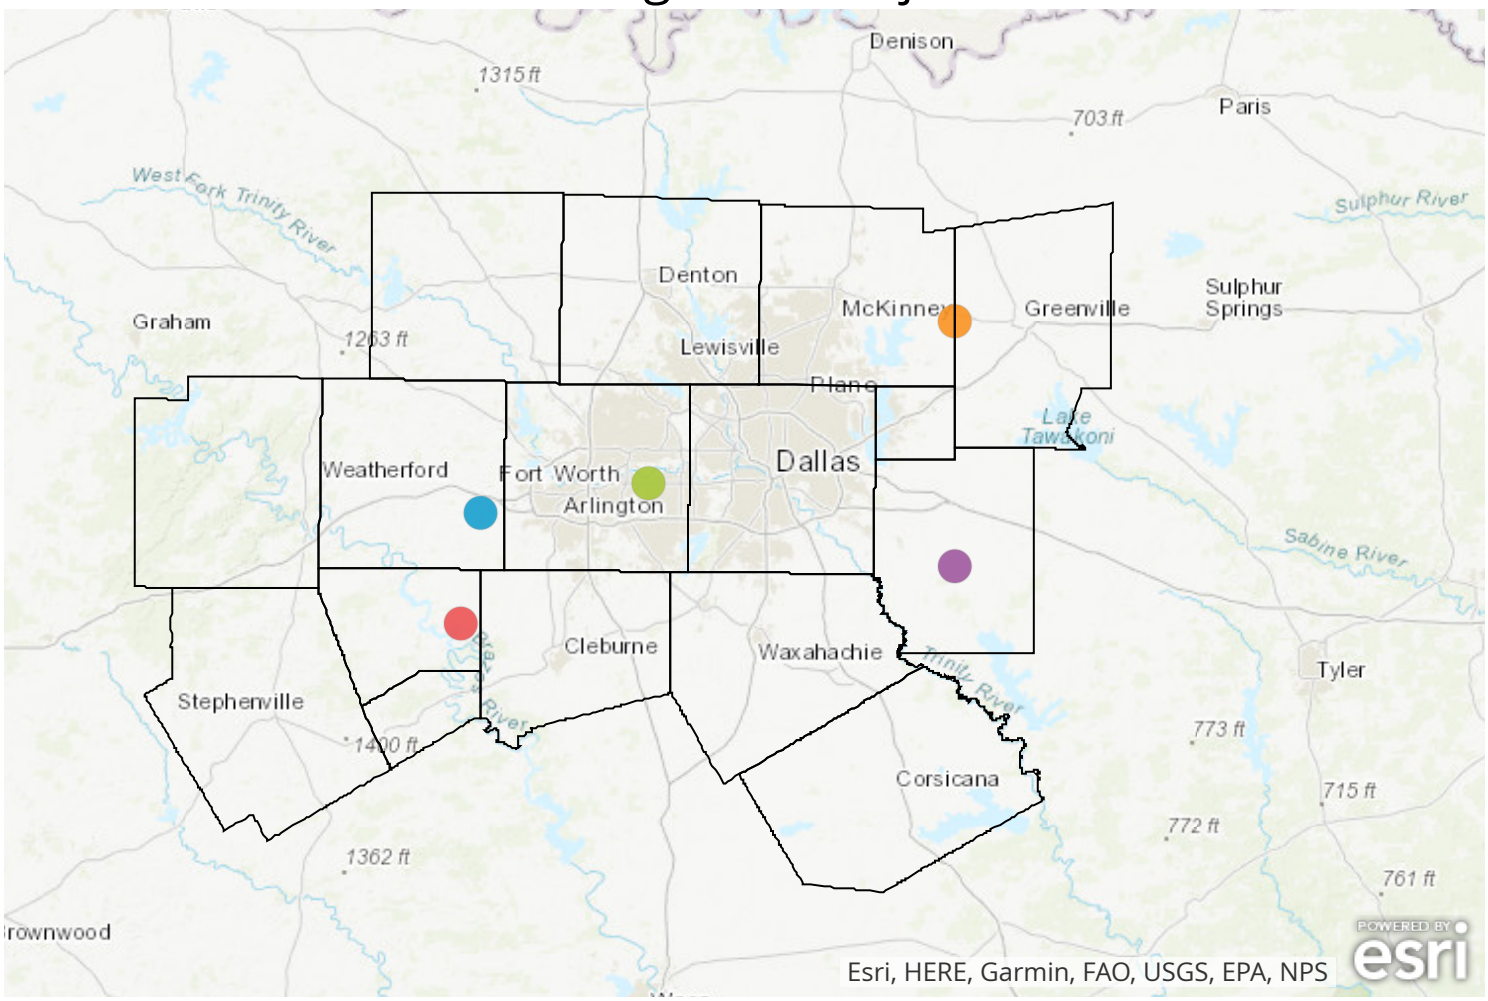

Sanitary sewer overflows (SSOs) are a type of unauthorized discharge of untreated or partially treated wastewater from a collection system or its components (TCEQ, 2018). SSOs can occur if there is significant inflow/infiltration, if the collection system is poorly operated or maintained, or the collection system lacks adequate capacity to collect or

store flows for treatment. The map shows the total number of reported SSOs in 2019 per county in the NCTCOG region.

Infrastructure solutions to address SSOs can be both time consuming and costly to address. The NCTCOG region has recognized that a significant way to minimize the number of SSOs is with education and outreach aimed at the proper disposal of fats, oils, and grease (FOG) which cause blockages in the sewer mains. The Wastewater And Treatment Education Roundtable (WATER) supports a region-wide effort to educate the public on FOG and to educate regional entities with trainings and workshops. More information on WATER's activities and initiatives can be found at this link: **https://www.defendyourdrainsnorthtexas.com/**.

Additionally, TCEQ has a voluntary program called the **Sanitary Sewer Overflow Initiative** (SSOI). The SSOI program was started in 2004 when an increase in SSO events was observed due to aging wastewater collection systems (TCEQ, 2019).

Clean Water State Revolving Fund Projects

Counties

CWSRF Projects (Sept 2019 - Apr 2020)

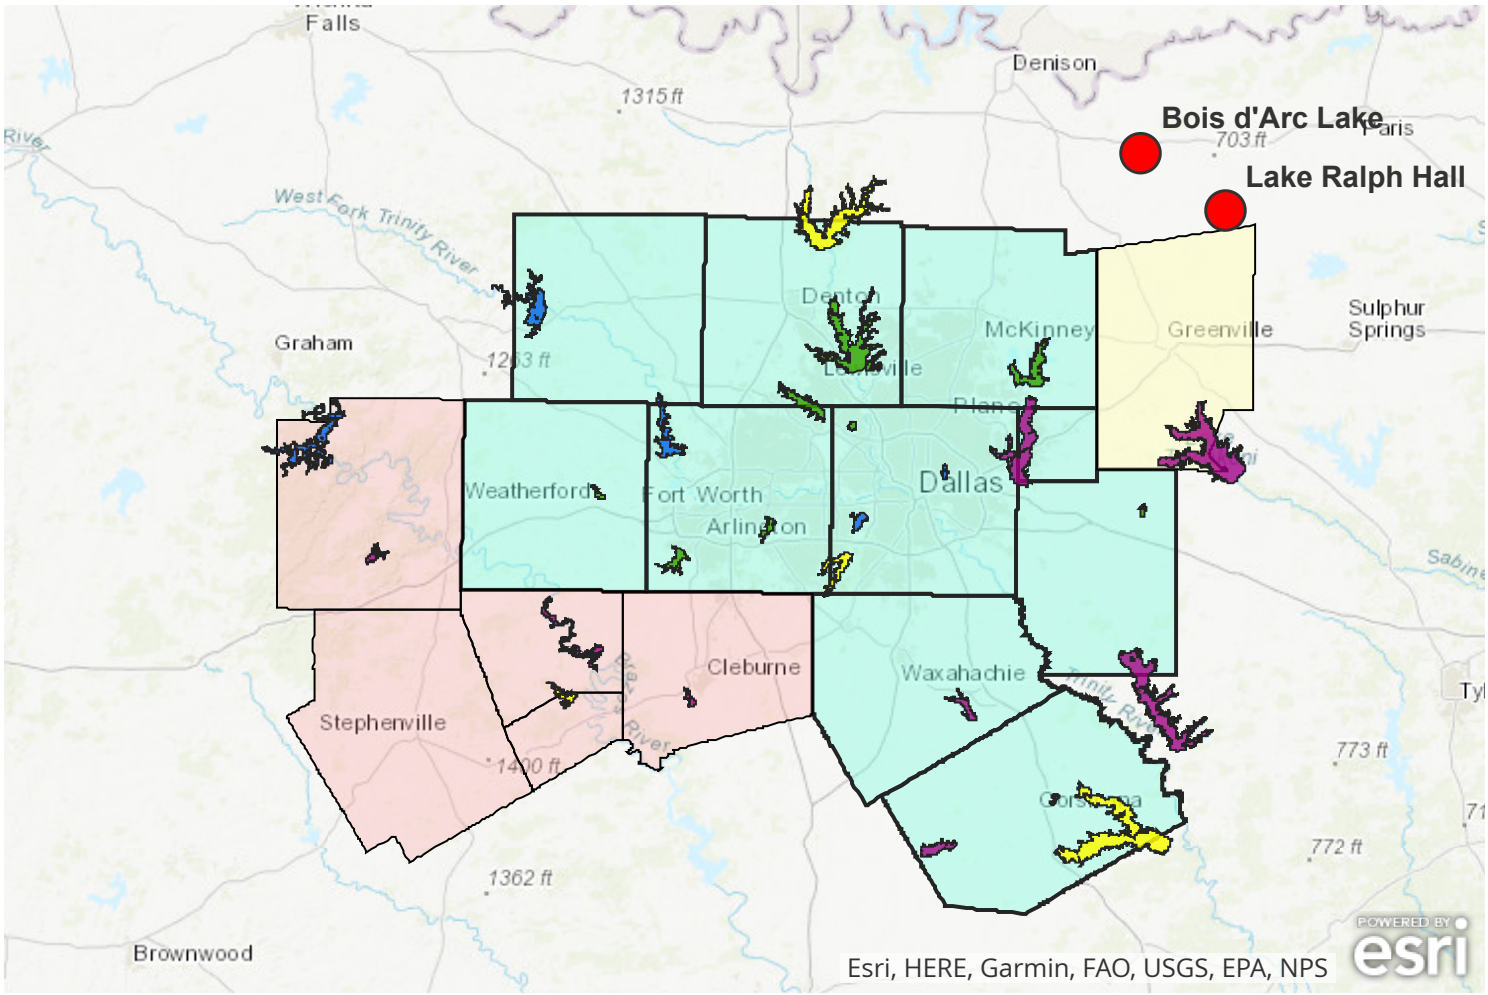

- Acton Municipal Utility District
- Aledo
- Fort Worth
- Greater Texoma Utility Authority/City of Kaufman
- North Texas Municipal Water District

As the designated water quality management planning agency for the North Central Texas region under Clean Water Act Section 208, NCTCOG evaluates Clean Water State Revolving Fund (CWSRF) projects that aim to develop and implement wastewater treatment management plans and practices to meet the goals of the Clean Water Act, and to coordinate with the state agency to ensure that plans developed under Section 208 are consistent with companion requirements under Clean Water Act Section 201, which relates to facility planning and funding of treatment facilities or infrastructure. The

208/201 coordination activities typically involve examination of facility plans submitted as part of funding applications. NCTCOG compares the facility planning information with regional goals and plans included as part of the current amended areawide Water Quality Management Plan.

NCTCOG performs a conformance review and provides the project plans to the Water Resources Council for expert input. NCTCOG compiles the feedback and submits responses to TCEQ for each project, acknowledging whether they are consistent with the current Water Quality Management Plan. NCTCOG completed five conformance reviews from September 1, 2019 to April 30, 2020. The table **here** provides information on each CWSRF project and summarizes the NCTCOG review outcome. The same information is also shown in the map by clicking on each of the five locations.

Region D Water Planning Group

Region G Water Planning Group

Region C Water Planning Group

Reservoirs

The NCTCOG region utilizes analyses on available water supply, water shortage, and water demand developed by the **Region C Water Planning Group** (WPG) who are tasked

with developing a regional water plan to recommend management strategies for water in North Texas. The **2016 Region C Water Plan** projects that 90% of the water shortages in 2070 will be for municipal users and predicts Collin, Dallas, Denton, and Tarrant Counties will have the largest water needs in the Region C area in 2070. [1] These forecasted needs encourage regional stakeholders to continue collaborating on best management strategies for meeting future water supply demands. NCTCOG supports the Region C management strategies for achieving water supply goals as laid out in the *2016 Region C Water Plan*.

There are 16 regional water planning areas in Texas. Six NCTCOG region counties fall into different regional water planning jurisdictions, however the recommendations for water management strategies serve to accomplish the same goals as Region C. The **Region G Water Plan** serves Plano Pinto, Erath, Hood, Somervell, and Johnson Counties, and the **Region D Water Plan** serves Hunt County.

In the 2016 Region C Water Plan, the Region C WPG defines major water management strategies as those that would supply more than 30,000 acre-feet per year and those that involve the construction of a reservoir supplying over 1,000 acre-feet per year for North Central Texas. (An acre-foot is defined as 325,851 liquid gallons.) [2] Two new reservoirs currently under development will supply water to the northern portion of the NCTCOG region and can be found on the map to the right just outside the NCTCOG region in Fannin County: Bois d'Arc Reservoir and Lake Ralph Hall.

The North Texas Municipal Water District (NTMWD) is working to incorporate the proposed Lower Bois d'Arc Creek Reservoir as a supplemental water supply for NTMWD member cities and customers through 2040. The reservoir will comprise about 26 square miles of surface areas and yield 120,200 acre-feet per year, or about 108 million gallons per day. NTMWD projects the reservoir will be providing vital water resources to citizens of Fannin County and members of the NTMWD district in the northern portion of the NCTCOG region by the spring of 2022. The construction of this reservoir is a recommended strategy from the Region C WPG. [3]

In September 2013, Upper Trinity Regional Water District was granted a water rights permit from the State of Texas to develop proposed Lake Ralph Hall located on the North Sulphur River also in Fannin County. In January 2020, the U.S. Army Corps of Engineers issued a section 404 Clean Water Act permit. This is the final federal permit required to construct the reservoir.

The proposed lake is projected to produce 39,220 acre-feet a year, or 54 million gallons per day, 19 million gallons a day of which will be from reuse. Water from Lake Ralph Hall will be delivered to Denton County and is expected by 2025. [4] The construction of this

lake is a recommended water supply strategy from the Region C WPG. The proposed locations for the Lower Bois d'Arc Creek Reservoir and the proposed Lake Ralph Hall Reservoir can be seen on the map, along with a timeline of overall reservoir construction in the North Central Texas region.

Water Reuse

According to the 2016 Region C Water Plan, reuse of treated wastewater effluent is becoming an increasingly important source of water in Region C. Reuse is projected to comprise about 27% of the 2070 water supply for the Region C water planning area, which includes most of the NCTCOG region. [5] The two types of reuse are:

Indirect Reuse - the placement of water, typically treated effluent, back into a water supply source, such as a lake, river, or aquifer, and then retrieved to be used again; and

Direct Reuse -treated wastewater is delivered from a wastewater treatment plant to a water user, with no intervening discharge to waters of the state.

Each category can be further defined by the end use, either potable (drinking purposes) or non-potable (non-drinking purposes). In North Central Texas, reuse typically occurs as direct non-potable reuse or indirect potable reuse. Direct non-potable reuse programs require notification to TCEQ, obtainment of a 210 Use of Reclaimed Water permit, and must meet state designated regulations designed to protect public health. This type of reuse is most commonly used to supply water to landscape irrigation and industrial uses.

Indirect potable reuse effects water rights in Texas and requires entities to demonstrate that its reuse scheme will not negatively impact downstream water rights holders and to receive permission from the state. [6] Indirect potable reuse programs use reclaimed water to augment drinking water supplies by discharging it to a water body, such as groundwater or surface water, which is subsequently treated for potable consumption. NTMWD implemented an indirect potable reuse project in Lavon Lake in 1985, diverting water from a wastewater treatment plant and treating it for municipal use as drinking water. [7]

During the 84th Texas Legislative Session, action was taken directing TWDB and TCEQ to support the creation of a direct potable reuse model under House Concurrent Resolution (HCR) No. 74. [8] HCR 74 identified the Dallas-Forth Worth Metroplex as the region to develop the model, as it is projected to house 32% of the state's population by 2070 and has the largest projected demand for new water supplies between 2020 and 2070, a 71% increase. [9] The model reuse project, in conjunction with renewable energy

technologies, could provide opportunities for public education on water reuse and renewable energy.

The Legislative action predicts that creation of a direct potable reuse project in Region C of the TWDB Water Planning Area has the potential to yield sufficient water supply to region residents while alleviating the depletion of already scarce resources.

Water Conservation

Water conservation is a crucial part of ensuring future water supply and improving water quality for North Central Texas. Based on questionnaire responses on existing water conservation strategies occurring in Region C and historical water use data, the Region C WPG determined that significant efforts have been made by water providers and water users to conserve water in the region. To this end, the WPG will continue to place a strong emphasis on water conservation and reuse as a means to reach water supply goals for future needs.

In the NCTCOG regional planning area, there are large efforts underway to promote the effectiveness of water conservation. Conservation is an important component to water resources in the region. Regional stakeholders and municipalities conduct public education, develop water conservation plans, implement green infrastructure, utilize water reuse, and implement watershed protection in order to obtain water conservation goals for future demands.

NCTCOG Water Resources Initiatives and Public Comments

TrinityRiver **Lakes** **Counties**

In North Central Texas, there are many entities working together through regional collaboration to help protect water resources. By 2045, the population of the NCTCOG region will increase by about 3.8 million. In order to keep up with the growing demands on our water resources, regional entities are working to improve the quality and quantity of water in this region. Often, people do not think about the scarcity and importance of water when it is available to them every day. Water, however, is a precious resource that needs protection. Ensuring appropriate water quality and quantity is a big job, but with the help of individuals, communities, and local governments, we can work towards gaining a better understanding of where our water comes from, how to protect the quality, and how to ensure availability of clean water for future generations. Many North Central Texas communities are working hard to protect water resources in the region. Local governments and regional entities work to engage and educate residents about water resources through outreach, incentives, and active communication.

In addition, NCTCOG actively engages regional entities in water quality and water resources efforts and initiatives.

Wastewater And Treatment Education Roundtable

Aiming to reduce potential damage to the region's household plumbing systems and wastewater treatment systems as well as to decrease hazards to water quality, the Wastewater And Treatment Education Roundtable (WATER) supports educational efforts related to the proper disposal of items such as wipes; paper towels; feminine hygiene and personal care products; medicines; household hazardous waste; and fats, oils, and grease (FOG). As part of this effort, WATER supports a regional FOG collection during the holidays. To learn more on how to properly dispose of problematic items, visit **http://www.ceasethegreasentx.com/**.

Total Maximum Daily Load Implementation Plan Program

NCTCOG is currently working in conjunction with TCEQ on the Total Maximum Daily Load Implementation Plan (TMDL I-Plan) Program addressing bacteria loading for several impaired water bodies in the Dallas-Fort Worth Metroplex. A TMDL measures the amount of pollutant that a waterway can have and still meet the water quality standards for its designated use. Twenty-two waterways in North Central Texas are currently included in the TMDL I-Plan program. For more information, please visit **www.nctcog.org/TMDL**. NCTCOG also coordinates with regional entities on a basin-wide approach to conduct and document efforts that help reduce the bacteria impairments in the Upper Trinity River Basin, one of the major river basins in the region, through the Upper Trinity River Basin Coordinating Committee. More information on the Upper Trinity River Basin Coordinating Committee can be found by clicking **here**.

Texas Smartscape

Texas SmartScape is an outreach program to educate residents on landscape best management practices, including the benefits of using plants that are native or adapted to our regional climate and local conditions. The program goals are to conserve local water supplies and improve stormwater runoff quality by reducing the amount of water needed to maintain landscapes while decreasing the amount of pesticide, fertilizer, and herbicides used. Many cities in the North Texas region have also participated in a recent effort to promote Texas SmartScape plants and the program by partnering with nurseries and garden centers on plant sale events. To learn more, please visit **http://www.TXsmartscape.com**.

Regional Ecosystem Framework

The development of the Regional Ecosystem Framework (REF) was a collaboration between the Transportation and Environment and Development departments at

NCTCOG. The REF uses a watershed approach to define areas of ecological importance. The REF was developed into an interactive viewer that allows users to evaluate the ecological priorities at the subwatershed level and overlay additional spatial data relevant to efforts to conserve natural areas or mitigate environmental impacts of infrastructure projects. For more information and to view the interactive mapping application, please visit **http://www.nctcog.org/REF**.

COMMON VISION Program

The Trinity River COMMON VISION Program is the coordination of local governments along the Trinity River who launched a regional initiative that promote a safe, clean, enjoyable, natural, and diverse Trinity River. The program established the Corridor Development Certificate (CDC) process to stabilize flood risks along the Trinity River. A CDC permit is required to develop land within a specific area of the Trinity floodplain. Under the CDC process, neighboring local governments along the Trinity River Corridor are given the opportunity to review and comment on projects in each other's jurisdiction. This process will help prevent any increase in flood risks as the Metroplex continues to grow. For more information, please click **here**.

***integrated* Stormwater Management**

The Integrated Stormwater Management (iSWM) program for Construction and Development is a cooperative initiative that helps cities and counties achieve their goals of water quality protection, streambank protection, and flood mitigation, while also helping communities reach their construction and post construction obligations under state stormwater permits. The program consists of four types of documents and tools that can be utilized by regional entities. There are 15 founding iSWM communities in the North Central Texas Region. Moving forward, cities will go through a certification to become an iSWM community. For more information, please visit **http://www.iSWM.nctcog.org**.

Trash Free Waters

United States Environmental Protection Agency (U.S. EPA) is currently working to develop a program with a focused set of national and regional actions that support trash prevention and reduction initiatives by many public and private stakeholders, resulting in significantly less trash entering watersheds. The goal is to begin approaching zero loadings of trash into coastal watersheds and ecosystems within 10 years. NCTCOG is working in partnership with communities along the Trinity River on a Trash Free Waters project to help reduce aquatic trash in the Trinity.

On April 22, 2020, U.S. EPA selected NCTCOG as a tentative awardee of its Trash Free Waters grant. The news release can be found **here**. NCTCOG's project, which will begin in the fall of 2020, will expand the **Trash Free Texas website**, reduce the use of single use

plastics in restaurants, and perform local outreach in the region through a myriad of events. For more information on U.S. EPA's Trash Free Waters program, click **here**.

For more information on these and other programs from the North Central Texas Council of Governments, visit **http://www.nctcog.org/envir**.

Public Comments on the 2020 Update to the North Central Texas Water Quality Management Plan

NCTCOG held a public comment period on the 2020 Update to the Water Quality Management Plan from May 24, 2020 to June 25, 2020. The comments received and NCTCOG's responses can be found **here**.
