

The Texas Disaster Information System (TDIS) is a comprehensive data platform intended for natural disaster management in Texas. TDIS aims to streamline the ingestion, storage, processing, and utilization of disaster-related data, with a focus on improving natural disaster preparedness, response, recovery, and mitigation efforts across Texas.

Decision Support Tools

We develop purpose-built applications specifically for disaster mitigation planning.

The Texas Disaster Information System is a project of **Texas A&M's Institute for a Disaster Resilient Texas**. It was created in partnership with the Texas General Land Office and the Texas Division of Emergency Management. There are more than 17 other state and federal partners, including the Federal Emergency Management Agency and the U.S. Army Corps of Engineers.

Knowledge Sharing

As an academic research group, we want to share what we've learned and replicate success across the state.

Field Research

Our team works with stakeholders across Texas to align with existing efforts.
