

Life Cycle of Drinking Water Educational Video Script

Do you know where the water from your tap comes from?

In North Texas, our drinking water is sourced from our local surface waters. This means the water is pulled from lakes, rivers, and streams. Our local water facilities treat this water by removing bacteria and pathogens in order to make our water safe to drink before pumping it into our homes!

Where does it go after it goes down the drain?

Once down the drain, water flows to a wastewater treatment plant. Here, it will be cleaned of harmful bacteria and treated. Then, it is released back into our lakes, rivers, and streams!
